SUPPLEMENTARY EDUCATIONAL MONOGRAPHS VOLUME 7-8

Rarebooksclub.com, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1918 edition. Excerpt: .Suppose I have the problem of finding the factors of $6a^2 - jx - 20$. Instantly I recall that the first term, $6x$, was obtained by multiplying two terms (the first term of each factor). The decision follows at once that these terms must be either (i) $3a$; and $2x$, or (2) $6x$ and x . Automatically comes the schematic form, with which I react habitually: $(31) (2)$. I examine the last term of the trinomial to find the probable second term of each factor; the recognition follows that the possibilities are $i0$ and 2 , or 4 and 5 , or 20 and i . I test my first hypothesis: that $i0$ and 2 with the proper signs may be the number sought. To do this I complete the schematic form stated above, giving $(3a; i0) (2 2)$. But through the visual imagery suggested by the curved lines I see that this arrangement could not give as the sum of the crossproducts the middle term-- jx . Instantly I interchange the 10 and the 2 , giving $(3 2) (2S 10)$. Similarly checking shows that the trial of this lead is false too. I try again, visualizing the factors of the second term, as 4 and 5 , with the proper signs attached. Checking this again by reference to the visual scheme $(3 4) (25 S)$, I recognize that the sum of these cross-products could be $-jx$ if the $15a$; were negative and the Sx positive. Thus I affix the signs, giving $(3+4)(2-5)...$
