If we have two simple equations containing two unknown quantities, we can usually derive from them a single equation containing only one unknown quantity. For example, suppose $x + y = 17$, and $x - y = 9$. Adding member for member, $2x = 26$; whence $x = 13$. And because $x + y = 17$, we have $13 + y = 17$; whence $y = 4$. 135. Simultaneous Equations. Two or more equations that have the same values for the unknown quantities are called simultaneous equations. 136. Elimination. The process by which we cause an unknown quantity to disappear in deriving an equation from a system of equations is called elimination. Thus in 134 we derived the equation $2x = 26$ from the system of equations $x + y = 17$ and $x - y = 9$, thereby eliminating y . The most common methods of elimination are (1) by addition (or subtraction as a special case),...
